said heat recovery system performs heat exchange, wherein said heat recovery system uses said exhaust gas supplied from said gas turbine as a heat source, and supplies steam generated in the heat exchange to a steam turbine system;

said steam turbine system performs expansion work, said steam turbine system comprising a condenser to condense said steam from said heat recovery system into water, said water being supplied to a heat exchanger in said coal gasification system, where said water is heated to steam, and wherein said steam from said heat exchanger is supplied to more than one high-temperature section of the gas turbine system which are at a temperature higher than a temperature of said steam from said heat exchanger.

3. (Three Times Amended) An IGCC according to claim 2, wherein said more than one high-temperature section of the gas turbine system is at least said gas turbine and a gas turbine combustor,

wherein said higher-temperature steam is directly supplied from said heat exchanger in said coal gasification system to said gas turbine, and

wherein said higher-temperature steam is first sent through a gas cleanup unit of said coal gasification system and then on to said gas turbine compressor.

33. (Amended) An integrated coal gasification combined cycle power generator (IGCC) comprising:

a coal gasification system for producing a combustible gas from coal, wherein said coal gasification system supplies said combustible gas to a gas turbine system;

said gas turbine system comprises a gas turbine for performing expansion work using said combustible gas, wherein said gas turbine supplies exhaust gas to a heat recovery system;

said heat recovery system performs heat exchange, wherein said heat recovery system uses said exhaust gas supplied from said gas turbine as a heat source, and supplies steam generated in the heat exchange to a steam turbine system;

said steam turbine system performs expansion work, said steam turbine system comprising a condenser to condense said steam from said heat recovery system into water, said water being supplied to a heat exchanger in said coal gasification system, where said water is heated to steam, wherein said steam from said heat exchanger is supplied to at least

-2-

one high-temperature section of the gas turbine system which is at a temperature higher than a temperature of said steam from said heat exchanger, and wherein high-pressure from an air compressor in said gas turbine system is supplied to cool the at least one high-temperature section of the gas turbine system if steam is not yet generated by said heat exchanger in said coal gasification system.

46. (Amended) An IOCC according to claim 42, wherein air generated in an air compressor in said gas turbine system is supplied to said at least one high-temperature section of the gas turbine system for the purpose of cooling said high-temperature section of the gas turbine system, producing a higher-temperature air, said higher-temperature air is recovered after cooling said high-temperature section of the gas turbine system and supplied to said heat recovery system.
